INTERFACE VS. INTEGRATION

It is clear that a consolidated and summarized electronic oral health record is in great demand by the practicing dentist. With the opportunity to provide this demand comes the responsibility to understand the technology. In an attempt to improve communications, we would like to provide clarification on the difference between Interface and Integrate.

So what’s the difference? Let’s take a look at how it really works!!!

INTERFACE:

So what does this mean? Interface, also known as a bridge, is where two or more separate software products communicate under limited capacity. Data is maintained in multiple locations; thus, requiring more administration.
INTEGRATE:

EAGLESOFT

- Practice Management
- Digital X-Ray
- Tooth & Perio Chart
- Video Capture
- Appointment Scheduler
- SmartDoc

A fully Integrated system means that the products are one. This happens when two or more products work closely together to combine different functionality into one product. The data is maintained in one location. EagleSoft is the first fully integrated digital imaging system capable of accommodating multiple imaging devices in a single high quality solution.
